

Problem Requirements Document - Zoom Access Notes

1. Problem Overview

1.1 Business Goal

Increase business account engagement and retention by improving post-meeting execution continuity within Zoom and reducing dependence on external follow-up tools.

1.2 User Problem

Zoom users struggle to retrieve decisions, action items, and shared files after meetings. This causes:

- Lost context
- Missed deadlines
- Fragmented workflows across multiple tools

1.3 Users & Persona

Primary Users: Product managers, leads, and knowledge workers

Behavior: 4–6 meetings/day, heavy file sharing, uses external tools for task tracking

Pain Points: Scattered follow-ups, repeated discussions, loss of context

Success: A single place to capture decisions & next steps without leaving Zoom

1.4 Why This Matters

When meeting outcomes are not captured reliably, teams repeat discussions, lose context, and rely on external tools for execution. This weakens Zoom's role in the daily workflow and reduces long-term stickiness in business accounts.

1.5 Why Existing Solutions Fall Short

- Meeting summaries are passive and difficult to operationalize
 - Chat messages become hard to revisit after meetings
 - Action items are not centralized or easily searchable
 - Users still rely on external tools for execution and follow-up
 - Existing outputs lack continuity across recurring meetings
-

2. Proposed Solution — Access Notes

Access Notes is designed to help users capture meeting outcomes at the moment they are discussed and reliably revisit them after the meeting, without disrupting the live conversation. Access Notes is a lightweight outcome capture layer and does not replace full task or project management systems such as Jira or Trello.

A persistent notes & task panel inside Zoom that:

1. Captures tasks automatically (AI) or manually during the meeting
2. Surfaces all notes & tasks post-meeting in a unified board
3. Links each task to transcript timestamps
4. Allows lightweight export to tools like Jira, Trello

2.1 Prototype Link

Figma Prototype:

>

2.2 Key Experience Previews

AI-generated action items surfaced during live discussions for quick confirmation or editing.
In-Meeting AI Suggestions

Manual Task Creation

Post-Meeting Access Board

2.3 Out of Scope

- Full project management workflows
- Sprint planning or dependency tracking
- Replacing Jira, Trello, or Asana

- Deep bi-directional workflow integrations
- Advanced collaboration systems such as comments or mentions

3. Key Features

3.1 Core Capabilities

- Real-time task detection (AI)
- Manual task creation (title, assignee, due date, notes)
- Task editing & completion
- Timestamp linking to transcript
- Structured decision capture
- Search & Filters by assignee, status, keyword, file-type
- Post-meeting board view

3.2 User Experience Overview

In-Meeting: Access Notes panel shows AI suggestions + manual tasks

Post-Meeting: A consolidated board with all tasks, files, decisions

Navigation: Access from Zoom Home → Access Notes → Task Details

4. Requirements

4.1 Functional Requirements

- **FR1:** Access Notes opens in-meeting as a panel, post-meeting as a full board
- **FR2:** Users can create, edit, assign, set due date, and mark tasks done
- **FR3:** AI suggests tasks; users can Accept, Edit, or Dismiss
- **FR4:** Each task links to transcript timestamp
- **FR5:** Users can search & filter tasks
- **FR6:** Access to meeting outcomes is restricted to meeting participants and follows Zoom's existing role-based permission model.

4.2 Non-Functional Requirements

- Low-latency AI processing to ensure suggestions appear within seconds during live discussion
 - Auto-save + recovery
 - Minimal learning curve
 - Scales across large enterprise accounts
-

5. Edge Cases

- Poor transcript quality → fallback to manual mode
 - Network drop → local auto-save + cloud sync
 - Tasks assigned to non-Zoom users → allow email-based access
-

6. Rollout Plan

- Private beta with selected enterprise accounts
 - Phased rollout to business customers
 - In-product onboarding + tooltips
 - Feedback loop inside Access Notes
 - During beta, Access Notes will be suggested contextually for recurring meetings and planning-type meetings to drive initial enablement.
-

7. Risks & Mitigations

- **Low adoption:** Show contextual guidance + AI automation
 - **Data fragmentation:** Auto-save + sync
 - **Permission issues:** Role-based visibility for sensitive tasks
-

8. Success Metrics

Measurement Scope

All success metrics are evaluated **only for meetings where Access Notes is explicitly enabled**. Enablement is treated as a signal that the user intends to capture and reference meeting outcomes

8.1 Success Metrics

1. Access Notes Enablement Rate

Definition

The percentage of meetings in which Access Notes is enabled.

Why it matters

This metric measures perceived value and adoption. Enablement is an explicit user action indicating that the meeting warrants structured outcome capture. Low enablement suggests the

feature does not yet align with user expectations or workflows.

2. Post-Meeting Access Notes Revisit Rate

Definition

The percentage of Access-Notes-enabled meetings where at least one participant views Access Notes after the meeting ends.

Why it matters

Revisiting Access Notes indicates that captured outcomes are useful beyond the live meeting. This metric validates that Access Notes serves as a reliable post-meeting reference rather than a passive artifact.

3. Outcome Interaction Rate

Definition

The percentage of Access-Notes-enabled meetings where users interact with at least one captured outcome after the meeting (e.g., opening a task, clicking a transcript-linked item, updating status, or exporting an outcome).

Why it matters

Interaction reflects intent to act or seek clarity. This metric measures execution readiness without assuming task completion within Zoom or relying on external tools

4. AI Suggestion Acceptance Rate

Definition

The percentage of AI-suggested outcomes above the defined confidence threshold that users accept rather than dismiss.

Why it matters

This metric evaluates the accuracy and usefulness of AI-generated suggestions and informs iteration on AI confidence thresholds and suggestion quality.

8.2 Future Opportunities

- Cross-meeting outcome rollups
- Smart reminders for pending follow-ups
- Team-level meeting effectiveness insights
- Context-aware meeting preparation
- Deeper integrations with enterprise workflow systems

8.3 Event Tracking

- access_notes_enabled
- access_notes_viewed_post_meeting
- outcome_created_manual
- outcome_created_ai
- outcome_interacted
- transcript_link_clicked
- access_notes_feedback_submitted
